

Let's continue our introduction to React. First, we will take a look at how to render a data collection, like a list of names, to the screen. After this, we will inspect how a user can submit data to a React application using HTML forms. Next, our focus shifts towards looking at how JavaScript code in the browser can fetch and handle data stored in a remote backend server. Lastly, we will take a quick look at a few simple ways of adding CSS styles to our React applications.

Part updated 14th August 2023
• Create React App replaced with Vite

- a Rendering a collection, modules
- b Forms
- c Getting data from server
- d Altering data in server
- e Adding styles to React app
